Version with markings to show changes made

In the Claims:

A marked-up version of claims 1 and 2 is presented below.

- 1. (Amended) A method for determining the activity range of a test compound, which modulates the uptake of serotonin by a serotonin reuptake transporter (SERT), against a secondary target, said method comprising the steps of:
- (a) contacting a first nematode expressing a mutated <u>Caenorhabditis elegans SERT</u> (CeSERT) polypeptide, wherein said mutated CeSERT polypeptide has a reduced capacity to take up serotonin relative to wild-type, with said compound;
 - (b) assaying a defined behavior of said first nematode; and
- (c) [assaying said defined behavior of a second nematode not contacted with said compound; and
- (d)] comparing said defined behavior of said first nematode to the defined behavior of a [that of said] second nematode not contacted with said compound, wherein a difference in said defined behavior between said first and second nematode indicates that said compound has a secondary target.
- 2. (Amended) The method of <u>either</u> claim 1 <u>or 12</u>, wherein steps (a) to <u>(c)</u> [(d)] are repeated using first and second nematodes selected from a panel of nematodes expressing mutant CeSERT polypetides, wherein said mutant CeSERT polypeptides differ from said mutated CeSERT polypeptide of step (a).
